

Client Meeting Notes:

September 4: Project Kickoff & Initial Goals

- Defined the initial MVP: a simple, frontend-only web app (no persistent backend storage yet).
 - User provides an RSS feed URL.
 - App fetches the RSS XML, parses it, and displays a list of songs with titles and album cover art.
 - User can click on a track to stream it.
- Defined the final vision:
 - Full playback controls.
 - Bitcoin Lightning micropayments for “value for value” support (boosts, streaming sats, etc.).
- Collected example music RSS feeds for testing:
 - Chill Pills (uppmixes).
 - A Wavlake music feed.
 - Spencer’s DeMu template repository.
 - Spencer’s example RSS for an album.
- Mentioned existing Podcasting 2.0 / value-for-value players as references:
 - LNBits ([lnbeats.com](https://lnbits.com)).
 - Curioaster (curioaster.com).

September 17: API, Wallets, and Feature Questions

Questions for Spencer

- How we can integrate the Podcast Index API into our project (for searching and discovering music feeds).
- What Steven Bell is doing with playlist functionality, and whether any of those ideas can inform our design.

Wallet & Lightning Integration

- Asked which Lightning wallet service is recommended for

Podcasting 2.0 listeners.

- Discussed Curioaster’s integration with Alby, including:
 - Alby login/signup on-ramp.
 - Paid Alby Cloud subscription (\$9.99/year).
 - The Alby GitHub org and JS SDK as possible tools for connecting to a wallet.

- Open questions about connecting our app to a Lightning wallet in a simple, user-friendly way.

Opening RSS Feeds

- UX question: how users specify the feed.
 - Option 1: Paste a URL to an online RSS file.
 - Option 2: Paste the raw RSS XML text.

Boosting

- Clarified behavior of boosts:
- When the user boosts a song, the sats and boostagrams should be sent to the artist's node using keysend (standard Podcasting 2.0 practice).

Display & Discovery

- How to use feed and item GUIDs to query and display additional track information.
- Ideas for browsing and discovery within the app:
 - Search for DeMu albums.
 - Sort by newest, most popular, or other metadata.

(Late September / Early October) – Feature & UX Ideas

- Show album-level information (description, art, metadata) in addition to listing tracks.
- Implement a “drip” streaming sats feature:
 - User sets a sats-per-minute rate.
 - While playback is active, track listening time.
 - Every 10 seconds, send a proportional drip of sats to the currently playing track's creator.
 - Pause drips when playback is stopped/paused.
- Allow user to reverse track order (ascending vs. descending).
- Before a boost is sent, show the user the approximate amount in sats and in dollars.
- After a boost, show some feedback/animation to make it feel rewarding and exciting.
- Noted that Robert's albums are hosted on JustCast; when opened in a Podcasting 2.0 app (e.g., Podcast Guru), you see a track list, thumbnail art, and supplemental info, which can act as a UX reference.

October 7: Responsiveness & New Feeds

- Confirmed the requirement that the web app should be responsive, especially for vertical smartphone viewing.
- Next action item for Robert:
 - Create an Alby test wallet and share credentials with the team (internally) so we can test Lightning flows.

- Shared a new RSS feed for a future album with a single track (not yet in Podcast Index) to use as a test feed:
 - “Things That We Can All Believe In” RSS URL.
- Provided a namespace documentation link for Podcasting 2.0 tags (e.g., guid):
- Podcast Namespace 1.0 docs.

October 14: Wallet Setup & Lightning Concepts

- Robert subscribed to Alby Pro Cloud for a year to help with our Lightning and Podcasting 2.0 testing.
- A Lightning node address for “Lovely Thinking’s” node was recorded and used for testing and routing payments.
- Set up Alby Hub (self-custodial wallet) and created:
 - A primary Alby wallet for Lovely Thinking.
 - A sub-wallet for the CS495 team to use during boosting and streaming-sats testing.
 - In this edited summary we omit any explicit passwords or sensitive wallet addresses and treat them as internal configuration details.
- Support from Alby (Jean Pierre):
 - Recommended joining the Get Alby Discord for help with Lightning node programming.
 - Suggested the Alby Go mobile app for seeing balances and sending/receiving sats on a phone.
- Robert opened a Lightning channel (via megalithic.me) to provide enough liquidity for sending and receiving sats.
- Shared a conceptual explanation of Lightning liquidity:
 - Channels act like an abacus; they allow off-chain, low-fee, near-instant microtransactions.
 - Sub-wallets share the same liquidity as the main wallet.

October 21: Testing Boosts & Additional UX Ideas

- Robert updated three JustCast-hosted music podcast albums with the correct Lightning node info so we can test boosts from our app and compare behaviors with Fountain, Curioaster, etc.
- Linked to a search for Robert Willey on Podcast Index and listed several albums to test with: <https://podcastindex.org/search?q=Robert%20Willey&type=all>
 - Peace Pieces 1993
 - Out of the Blue 2006
 - Into the Blue 2007
 - True Blue 2012
 - “Lovely Playalong Tracks” (a growing series)
 - “Things That We Can All Believe In” RSS feed.
- Stated that boosts from these albums should show up in the Lovely Thinking wallet, which we use for verification.
- Listed other supported podcasts whose boosts we might also test with:
 - Bowl After Bowl (Spencer). <https://podcastindex.org/podcast/946122>
 - Homegrown Hits (Laurien). <https://podcastindex.org/podcast/6611624>

- Podcasting 2.0 (Adam & Dave). <https://podcastindex.org/podcast/920666>
- Boostagram Ball (Adam Curry). <https://podcastindex.org/podcast/6524027>
- Boostagram UI detail: when we implement boosts with comments, include a clear label stating the boost is coming “from RSS Music Player app.”
- Validation idea: if a user submits a feed that is not type=music, we may:
 - Show a warning that the app is optimized for music, even though it might still work for typical podcasts.
 - Interaction idea: allow users to swipe right on a track to remove it from the album’s track list (e.g., to skip or hide unwanted songs).

November 12: UI Design Review

- In this meeting, Dr. Willey provided UI design sketches and concepts for the RSS Music Player.
- Key screens and elements mentioned:
 - Launch / Home screen with the app title (“RSS Music Player”).
 - A clear “Open an RSS feed” entry point.
 - A Play screen for playback controls.
 - A “Value for Value” section for boosts, streaming sats, and wallet interactions.
 - A “Connect Alby Wallet” flow.
 - A Help section for onboarding and explaining concepts.
- The notes suggest a focus on:
 - Clean navigation between open-feed, playback, and value-for-value actions.
 - Explicit callouts for wallet connection and assistance.

December 3: Architecture Update & Presentation Planning

- This meeting was mostly an overall project review.
- Brody reported that he is moving the RSS parser to the backend, shifting from a purely frontend-only approach to an architecture where parsing happens server-side.
- The team discussed presentation timing, and Dr. Willey expressed interest in attending the final presentation.
